SAFAPS Backlog

Sprint 1

1. Provide a description of the SAFAPS API

Sprint 2

1. Create manually 1 organization account (ex: SAMO)
2. Create a mock for the SAFAPS API (callable methods with the specified format, that don't do any background logic work)
3. Test the API using some 'dummy' data respecting the format (the purpose is to check if the API is working, you don't need to have the implemented algorithms or all the back-end logic)

Next Sprints

(Will be detailed by the team that will be responsible for NARMS during those sprints)
